

Raymond Flores

Austin, TX · (956) 789-3046
raymondfflores@gmail.com · linkedin.com/in/raymondff22

Full-stack engineer with 10+ years in TypeScript, React, and Node. I own the layer between services and the client — designing APIs, choosing rendering and architecture strategies, and shipping the interfaces on top. Experience spans platform work at consumer scale to founding two companies where I built everything from device firmware to payment ledgers. Comfortable where correctness matters: regulated gaming, real-money transactions, and production systems under load.

EXPERIENCE

Caesars Sportsbook — Senior Software Engineer

REMOTE · MAR 2023 - PRESENT

- Led a rebuild of the multi-brand content platform, diagnosing that client-side CMS fetching left content invisible to search crawlers; re-architected to build-time rendering with Astro. Organic clicks +137%, average search position 15.4 → 11.3, Lighthouse Performance 65 → 99, Total Blocking Time 0 ms. Delivered in ~2 months leading 1 engineer and 1 QA.
- Built a Node service on GCP Cloud Run orchestrating webhook-triggered rebuilds and deploys from CMS publishes, removing engineering from the content publishing path entirely.
- Designed a CMS-driven variant page system letting marketing compose and ship dozens of pages with zero code or deploy requests; adopted as the standard across brands. Architected the underlying self-serve landing page platform enabling rapid experimentation across 4 sportsbook and casino brands.
- Designed a compliant content publishing process for an NJDGE regulatory requirement — separating authoring, approval, and publish rights across 4 brands and hundreds of pages; passed audit with zero compliance failures since.
- Built GitLab CI/CD pipelines from scratch with webhook-triggered builds, automated checks, and release notifications, eliminating manual deploy steps.
- Re-architected an affiliate attribution pipeline processing tens of thousands of events daily, restoring partner trust and improving acquisition quality.
- Built the front end of authentication and onboarding used by millions of monthly users across web and React Native; implemented deep-linking architecture (AppsFlyer) and analytics instrumentation across iOS and Android.
- Mentor engineers and set frontend architecture standards across the team.

Nifted — Co-Founder & CTO

REMOTE · SEP 2021 - SEP 2024

- Co-founded a consumer hardware company selling networked digital display frames; sole technical founder of four, raised \$150K and shipped ~200 units — first edition sold out in 10 minutes.
- Built the entire stack: Raspberry Pi device software, a React/TypeScript display UI inside a Flutter shell, a Flutter companion app, a Nuxt/Vue storefront, and the API underneath.
- Architected a Node/TypeScript GraphQL API (Apollo Server, TypeGraphQL, TypeORM, PostgreSQL) aggregating five third-party APIs and two blockchains into one normalized schema serving three heterogeneous clients, shaping payloads per client.
- Built end-to-end Stripe payments — checkout sessions, webhook handling, order lifecycle, per-edition inventory — plus device identity, account claiming, and JWT/argon2 auth.

Evaluate.xyz — Senior Software Engineer (First Engineering Hire)

REMOTE · JUL 2021 - FEB 2023

- First engineering hire on a 3-person founding team building a chat-based NFT portfolio and analytics platform; built and maintained core product surfaces across a React/TypeScript frontend — portfolio views, collection search and discovery, price charting, in-app chat, and the shared design system.
- Built real-time data visualization — WebSocket-driven live price and candlestick charts (apexcharts, d3, react-stockcharts) with heavy render-path optimization.
- Platform grew to 1.4M+ users tracking 1,100+ NFT collections across Flow and Ethereum; raised a \$4M seed (Rho Capital's Ignition Fund, Dapper Labs, Drive by DraftKings, Castle Island Ventures).

Tesla — Software Engineer

REMOTE · MAR 2021 - SEP 2021

- Built and optimized the customer-facing vehicle trade-in flow on Tesla.com (React, PHP), improving submission completion and reducing checkout friction.
- Built internal inventory tooling tracking trade-in vehicles through routing, disposition, and sale.

Boom Sports — Senior Software Engineer

REMOTE · SEP 2020 - MAR 2021

- Developed React Native free-to-play gaming apps for NBC Sports (NBC Sports Predictor) and Barstool Sports, supporting high concurrency during peak live events.
- Built a user service (Node, Redis, MongoDB) handling authentication, sessions, and user state across multiple client applications.
- Built admin tooling for daily and weekly contest management and real-time contest monitoring (React, Node, Express, MongoDB).

Ticketmaster — Senior Software Engineer II

PHARR, TX · JAN 2019 - AUG 2020

- Rebuilt Ticketmaster's legacy call center application from Visual Basic to React/Redux — the system managers used to run day-to-day operations. Achieved 87% faster load times and a 10x smaller codebase through table-driven architecture and reusable components.
- Introduced real-time reporting and customizable dashboards, letting teams generate custom reports on demand.
- Digitized and automated paper-based workflows, consolidating multiple internal tools into one and cutting manual processing cost.

PokerSports — Co-Founder & CTO

REMOTE · OCT 2016 - JAN 2019

- Built and operated FantasyStud, a real-money fantasy sports platform end to end — an AngularJS SPA plus a separate admin console on an Express / PostgreSQL / Redis backend; 2,200+ commits over 2.5 years, ~15K lines across 22 service modules.
- Implemented real-money payments with Braintree: deposits, user balance ledger, pot handling, winner payouts, and webhook reconciliation.
- Built real-time multiplayer with socket.io and Redis, routing live balance, table-state, and notification events to specific user connections.
- Designed and evolved the PostgreSQL schema across 38 migrations; ran production infrastructure (Linux, NGINX, PM2, scheduled jobs, Rollbar); hired and mentored 2 junior developers.

PROJECT

BirdieLab — birdielab.app

- Designed and shipped BirdieLab (v1.4.0), a golf round tracker for iOS and Android — hole-by-hole scoring, on-course GPS distances, USGA handicap index calculation, course discovery, and reviews.
- Own both sides of the stack: Expo SDK 54 / React Native / Apollo Client against a Node, Apollo Server v4, and TypeGraphQL API with DataLoader batching, rate limiting, and Supabase Postgres with ES256 JWT auth — plus push notifications, offline handling, an automated course data pipeline, an Astro landing page, and EAS build/submit with OTA updates on GitHub Actions CI.

SKILLS

Languages: TypeScript, JavaScript, SQL

Frontend: React, React Native (Expo), Next.js, Astro, Vue/Nuxt, Vite, Redux, Zustand, React Query, Tailwind, performance optimization

Backend: Node.js, Express, GraphQL (Apollo Server, TypeGraphQL), REST, WebSockets, PostgreSQL, MySQL, MongoDB, Redis

Payments: Stripe, Braintree

Cloud & Infra: AWS, GCP (Cloud Run), Supabase, CI/CD (GitLab CI, GitHub Actions, EAS)

Observability & Testing: New Relic, Dynatrace, Rollbar, Jest, React Testing Library, Playwright

AI: LLM-assisted development, multi-agent orchestration, automated workflows

EDUCATION

University of Texas - Rio Grande Valley — B.S. Computer Science · Edinburg, TX
